Information Systems

MIS Chapter 9 Highlights

The growing trend toward global customers and products means **globalization** has also become an important factor in purchasing and the supply chain.

Mobile apps play a major role in globalization by offering basic social services and commerce such as banking, payment, and agricultural information for developing nations.

A **GIS** can be defined along two dimensions: control and coordination. Control consists of using managerial power to ensure adherence to the organization's goals. Coordination is the process of managing the interaction among activities in different, specialized parts of an organization.

International companies can use a variety of technologies for an integrated GIS. Small companies might outsource to take advantage of expertise that is not available inside the company.

TDF restricts what type of data can be transmitted in foreign countries.

A **multinational structure** is a company where production, sales, and marketing are decentralized, and financial management remains the parent's responsibility.

offshore outsourcing is where an organization uses an outsourcing firm in another country to provide needed services or products.

Factors that can hinder the success of a GIS include

- **Lack of standardization**
- **Cultural differences**
- **Diverse regulatory practices**
- **Lack of skilled analysts and programmers**
- **Poor telecommunication infrastructures**
